Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Synthetic.			_	Extracellular domain; CD64; identification; antibody;		Oligopeptide from extracellular domain of CD64.		18-AUG-1998 (first entry) '		· W60553;		W60553 standard; peptide; 12 AA.	53	LT 1

method for the identification of a peptide able to bind specifically to a target protein. The method comprises displaying the peptide on the surface of a replicable display package, synthesising oligopeptides derived from the target protein on a solid phase, and testing for binding between the peptide and oligopeptides. The method is used to screen large peptide libraries, especially to detect antibodies, or their fragments, that bind to cell markers or thousand sifferent forms of the same protein, including bispecific antibodies that bind to two non-overlapping epitopes on the same monomeric antigen or two epitopes on different molecules. The genes/foligonucleotides that encode

Synthetic oligopeptides W60537-61 are derived from the extracellular domain of CD64. They were synthesised on 25 polyethylene rods as adjacent, non-overlapping sets. Peptide specific phages were isolate.

The specification describes a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes a novel model of an FC receptor (FCR) protein CC representing a three-dimensional (3-D) structure that substantially CC conforms to the specified atomic coordinates. Computer model images of the FCR can be used to design bioactive chemical compounds, e.g. cligonucleotides, peptides, peptidomimetics and small organic molecules, by computer-assisted methods of drug design. Therapeutic compositions CC by computer-assisted methods of drug design. Therapeutic compositions CC that inhibit the activity of FC-qammaR or FC-epsilonR can be used to reduce IgG- or IgE-mediated tissue damage, e.g. IgG- or IgE-mediated hypersensitivity, recruitment of inflammatory cells or release of CC inflammatory modulators. The therapeutic compositions can also be used to treat disease in animals. The knowledge of the 3-D structure of FC-gamma CC RIA and models of other FCR provides a means for designing and producing CC compounds that regulate immune function and inflammation in an animal, CC including humans (i.e. structure based drug design). For example, including can be designed to block binding of immunoglobulin to the processor of the structure based drug design and models.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                        13-JUL-1990;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         an Fc receptor protein using various computer programs and models. The products of the invention have anti-inflammatory and immunoprotective activity. This sequence represents the human sFC-gammaRI protein fragment described in the method of the invention.

The amino acid sequence (R91439) of human FCRI was detd. from a cDNA clone, p98 (T14718), obtd. from a cDNA library using an cDNA clone, p98 (T14718), obtd. from a cDNA library using an common control clothing method. FCRI is a high affinity receptor for the FC portion of IgG, normally located on cell surfaces of macrophages. 2 Other cDNA clones, p135 (T14717) and p90 (T14719), coded for a variants of the FCRI sequence; the C-terminal sequence of the p98 product is truncated compared with those of the p135

sclerosis. FCRI is a high affinity receptor for the Fc portion of IgG, normally located on the cell surfaces of macrophages. The ability to interfere with such bonding, or to cause it to occur on surfaces other than macrophages, is useful in therapy. A fusion protein of FCRI and a receptor ligand will be helpful to increase
                             surfaces other than macrophages, is useful protein of FCRI and a receptor ligand will the potencies of antibodies in therapy.
                                                                                                                                                                                                                   (panning on) an antibody-coated substrate such as a culture dish. CSA nucleic acids isolated by the method of the invention, and the proteins they encode, are useful for immunodiagnostic and
                                                                                                                                                                                                                                                                                                                             The present sequence is that of a human macrophage specific FCRI, as deduced from cDNA clone p135 (see A50631), which was isolated from a cDNA library expressed in COS cells using a novel method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Isolated nucleic acid molecule encoding the CD19 cell surface antigen, useful for immunodiagnosis and immunotherapy of immune-mediated infections or disorders, e.g. asthma, immune-complex disease, parasiti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Stamenkovic I,
                                                                                                                                                                                immunotherapeutic applications, including the diagnosis and disorders in treatment of immune-mediated infections, diseases, and disorders in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             position 25; p135 encodes a Ser residue and the other two clones predicts a Thr residue. At position 58, p135 predicts Leu and p90 predicts Val. Sequences predicted from all 3 clones show the typical features of a type I integral membrane protein and include a short hydrophobic signal sequence, a single 21-residue hydrophobic membrane-spanning domain, and a short, highly charged cytoplasmic domain. The extracellular portion contains six potential N-linked glycosylation sites and six Cys residues distributed among three C2 set Ig-related domains. A fusion protein of FCRI and a receptor ligand will be helpful to increase the potency of antibodies in therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This amino acid sequence was predicted from the cDNA sequence of cDNA clone p90. It differs from the sequence predicted from clone p135 (see 021178) at position 25; p135 encodes a Ser residue and clone p90 predicts a Thr residue. At position 58, p90 predicts val while clones p135 and p98/X2 (see 021179) both predict Leu. Sequences predicted from all 3 clones show the typical features of a type I integral membrane protein and include a short hydrophobic signal sequence, a single 21-residue hydrophobic membrane-spanning domain, and a short, highly charged cytoplasmic domain. The extracellular portion contains six potential N-linked glycosylation sites and six Cys residues distributed among three C2 set Ig-related domains. A fusion protein of FGRI and a receptor ligand will be believed beliefil to increase the potency of antibodies in the server.

                                                                                                                                                                                                                                                                                                                                                                                                                    The amino acid sequence (R91438) of human FCRI was detd. from a cDNA clone, p135 (T14717), obtd. from a cDNA library using an immunoselection cloning method. FCRI is a high affinity receptor for the FC portion of IgG, normally located on cell surfaces of macrophages. Another isolated cDNA clone, p90 (T14719), coded for a variant (W00859) of the FCRI sequence, and a third clone, p96 (T14718), coded for an FCRI (R91439) having a different C-terminal sequence. A fusion protein of FCRI and a receptor ligand will be helpful in increasing the potency of antibodies in therapy.

FCRI is a high affinity receptor for the FC portion of IgG, normally located on cell surfaces of macrophages. Other cDNA clones (see also T14717-18) coded for variants (R91438-39) of the FCRI sequence. A fusion protein of FCRI and a receptor ligand will be helpful in increasing the potency of antibodies in therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cloning of cDNA encoding cell of diagnostic and therapeutic

                                                                                    the isolation and cloning of any protein which can be expressed and transported to the cell surface membrane of a eukaryotic cell. It has been used to clone genes (see V63442-63) encoding cell surface antigens from mammalian lymphocytes (see W80440-55). The isolated genes can be expressed in a prokaryotic or eukaryotic host cells to produce the encoded protein. The invention also provides high efficiency expression vectors (see V63441 and V63444) which allow the generation of very large mammalian expression libraries. The purified genes and proteins are useful for immunodiagnostic and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     13-JUL-1989;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   expression libraries is based on transient expression of an antigen in eukaryotic cells and selection of cells expressing the antigen by adhesion to an antibody-coated substrate. The method is useful for the isolation and cloning of any protein which can be expressed and transported to the cell surface membrane of a eukaryotic cell. It has been used to clone genes (see V63442-63) encoding cell surface antigens from mammalian lymphocytes (see W80440-55). The isolated genes can be expressed in a prokaryotic or eukaryotic host cells to produce the encoded protein. The invention also provides high cefficiency expression vectors (see V63441 and V63444) which allow the generation of very large mammalian expression libraries. The purified genes and proteins are useful for immunodiagnostic and immunother apeutic applications, including the diagnosts and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cells. The cDNA library was constructed from polyA RNA of cells from a single patient undergoing extracorporeal interleukin-2 induction therapy. Clones p135 (see V63456) and p90 (see X07372) were also obtained. A novel method for cloning cDNAs from mammalian

FcRI is a high affinity receptor for the Fc portion of IgG, normally located on the cell surfaces of macrophages. The ability to interfere with such bonding, or to cause it to occur on surfaces other than macrophages, is useful in therapy. A fusion protein of FcRI and a receptor ligand will be helpful to increase

may be modified to produce recombinant versions. The recombinant Ro receptor consist only of the extracellular portion of the receptor and are not glycosylated i.e. they do not have transmembrane domains or signal peptides. The recombinant proteins may be used in immunoassays t determine the immune status of patients with chronic diseases of the immune system, e.g. AIDS, systemic lupus erythematosus (SLE), multiple myeloma (MM), or rheumatoid arthritis. In addition, pharmaceutical compositions containing recombinant proteins may be not the treat or compositions containing recombinant proteins may be not the treat or compositions containing recombinant proteins may be not the treat or compositions containing recombinant proteins may be not the treat or compositions containing recombinant proteins may be not the treat or compositions containing the proteins may be not the treat or compositions containing the proteins may be not the proteins and the proteins are proteins and the proteins and the proteins are proteins are proteins.

FcgammaRI molecules are expressed by monocytes and macrophages, but expression can also be induced on neutrophils and eosinophils. Upon Fc receptor activation, immune effector pathways are activated, leading to immune response. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       glycosylation, cancer -

cc antityroid; antialization, antibacterial; antiviral; dermatological; cc neuroprotective; cardiant; thrombolytic; coagulant; nootropic; antipsoriatic and antianglogenic. The polynucleotides and conditions and diagnosing pathological conditions. Polynucleotides, conditions and personable and antagonists from the present cc invention may be used to treat immune disorders by activating or inhibiting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoietic cells, autoimmune disorders, callergic reactions, graft versus host disease and organ rejection, comodulate haemostatic or thrombolytic activity, modulate inflammation, cc cancers, cardiovascular disorders, neurological disease and bacterial or viral infections. The peptides, nucleotides, authordies, agonists and cantagonists may be also be used in drug screens. C78449 to C78457 and convention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               C77607 to C78448 encode the human cancer associated proteins given in B43398 to B44239. The proteins can have activities based on the tissues and cells the genes are expressed in Example of activities include: cytostatic; proliferative; vulnerary; immunomodulator; antidiabetic; antiasthmatic; antirheumatic; antiarthritic; antiinflammatory;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel isolated nucleic acids comprising sequences encoding peptides useful for treating or diagnosing e.g. cancer \cdot

        Pred No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                            Score
